

Post Traumatic Pseudolipoma - Clinical Images

Neeraj Kumar*

Associate Professor, Dept. of Shalya Tantra,
Shree Swaminarayan Ayurveda College Kalol, Gandhinagar, Gujarat, India

Description:

A 50-year-old male without comorbidities came to the *Shalya Tantra* OPD (Ayurveda Surgery) on foot with the primary concern regarding swelling over forehead gradually growing in size since 17 months. He had underwent deceleration injury before 18 months while traveling in the bus. Initially swelling was small but gradually enlarged without any pain and other symptoms. Ultrasonography findings suggest sub-galeal lipoma, but clinical summary supports the sign and symptoms of pseudolipoma. The swelling was excised and sutured as per conventional surgery.

Discussion:

Ultrasonography findings showing sub-galeal lipoma has characteristics like firm, fixed, immobile mass. ^[1] But in the clinical findings the swelling was semisolid, mobile, movable and positive slip-sign. ^[2] The traumatic history over forehead supports the diagnosis of post traumatic pseudo-lipoma as available observation study found most common site of traumatic pseudo-lipoma commonly found over abdomen, face, scalp and greater trochanter of femur. ^[3]

Keywords- Lipoma, Pseudolipoma.
